Customer Reviews

When the agile movement re-cast the roles of the SDLC they did so with small projects as the baseline of their experience. A typical minimal SDLC method includes subject matter experts (those who execute the current workflow activities), a Project Manager, a Business Analyst, a Software

Architect, UX specialists, Developers, DBAs, and Testers. A Scrum Team consists of a Product Owner, the Development Team, and a Scrum Master. The typical SDLC method responsibilities for activities, and the skills needed to get them done, went from 8 roles down to 3. For small projects that is great, but as the industry is learning the hard way, for bigger projects it just doesn't cut it. The product owner role received a lot of responsibilities. This means they also are expected to have a lot of skills. By no fault of their own, this is not usually the case. Along with the lack of skills, I also usually see them floundering for the authority needed to be effective. I do not understand why there are so many people that believe changing a person's job title will somehow magically give them the skills needed to do the job. The activities needed to build software successfully didn't change when agile was explicitly introduced to software development. Agile has implicitly always been a goal of software development projects. The activities required to successfully build software were just moved around, redefined to give them a new context, renamed, and in some cases ignored. If the team adopting Scrum is dysfunctional, they remain as dysfunctional as they were before attempting to use Scrum. Their skills and experience didn't change by moving the team to a new method of managing the project.
